

## Press Release

Berlin, June 20th, 2019

### **SCOPELAND rated as a Contender among Low-Code Platforms For Business Developers by US analysts**

Systematic evaluation of twelve global vendors based on 30 criteria

**The product SCOPELAND by the Berlin-based company Scopeland Technology is one of the twelve most significant Low-Code platforms for business developers, i.e. software developers from the specialist areas of large companies. This is one of the conclusions of the current evaluation "The Forrester Wave™: Low-Code Platforms For Business Developers, Q2 2019".**

According to the report, the deep data-design and database-development features of SCOPELAND are noted as "impressive". The report goes on to say that SCOPELAND's platform "handles maps and geolocation information in apps very well, and it has strong reporting features."

"In my view, SCOPELAND differs from most other Low-Code platforms by its clear focus on IT architectures, as they dominate in Germany in almost all large companies and authorities until today. Unlike most US competitors, Scopeland Technology does currently not have its own cloud and has therefore not been able to score with cloud platform features," explains founder and CEO Karsten Noack. "I believe that SCOPELAND's performance in this report shows how consistently and comprehensively the basic idea of Low-Code, i.e. interactively 'clicking together' instead of programming, has been implemented in this product. If one adds up only those aspects, which give information about how well a Low-Code platform is suitable in order to convert comprehensive and fastidious software solutions without manual programming, I believe that SCOPELAND is clearly one of the prominent Low-Code platforms at all, perhaps even the most efficient. This is confirmed by daily project experience, according to which SCOPELAND is able to generate up to 99.2% of the entire program code fully automatically in real large-scale projects. In my view, this is underlined by Forrester analysts' evaluation of SCOPELAND as a 'mature database power tool'."

In addition, SCOPELAND believes that it is the only one of the leading Low-Code platforms capable of using the Low-Code principle to map sophisticated geodata processing and numerous other requirements of large projects. SCOPELAND is also a pioneer with its patented process for generating electronic documents. The SCOPELAND Report Builder enables users with less IT knowledge to obtain any evaluations from extensive relational data sets. An extra feature is the fully automatic generation of the complete project documentation, which generates thousands of pages of accurate, up-to-date documentation with a single mouse click.

## About Scopeland Technology

The Berlin-based company Scopeland Technology is one of the pioneers of Low-Code technology and in Germany still one of the most important players in the rapidly growing Low-Code market. Scopeland Technology has already implemented more than 500 larger projects with its platform itself. Customers are mainly federal and state authorities, research institutes, health care institutions and large industrial companies. Scopeland Technology is currently expanding its partner network in order to broaden its business base. One of the objectives is to increasingly shift the project business to partner companies in order to be able to concentrate more on the actual product development.

Low-Code platforms enable the development of tailor-made IT solutions without or almost without programming. This revolutionary new approach enables efficiency increases by a factor of 10 compared to traditional manual software development. Accordingly, US analysts such as Gartner and IDC predict that Low-Code technology will completely replace large parts of previous software development. Low-Code is regarded as one of the key elements of digital transformation. If it happens as predicted, this will be the biggest paradigm shift in software development in a long time. Leading providers of Low-Code platforms from the USA are already estimated to be worth billions of US Dollars today, and hundreds of new manufacturers are currently entering the market. In the US, every fourth company already uses Low-Code products on a large scale, with only Germany lagging somewhat behind.
